

CHANGING APN SETTINGS

Firstly you will need to connect to your 4G 360 Cameras WiFi hotspot

You will need to go into your phones settings and find available WiFi networks.

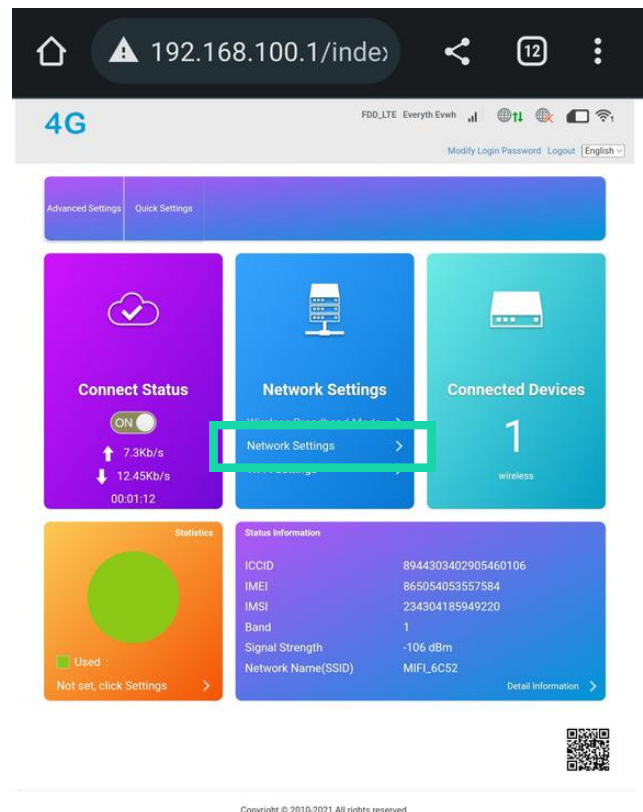

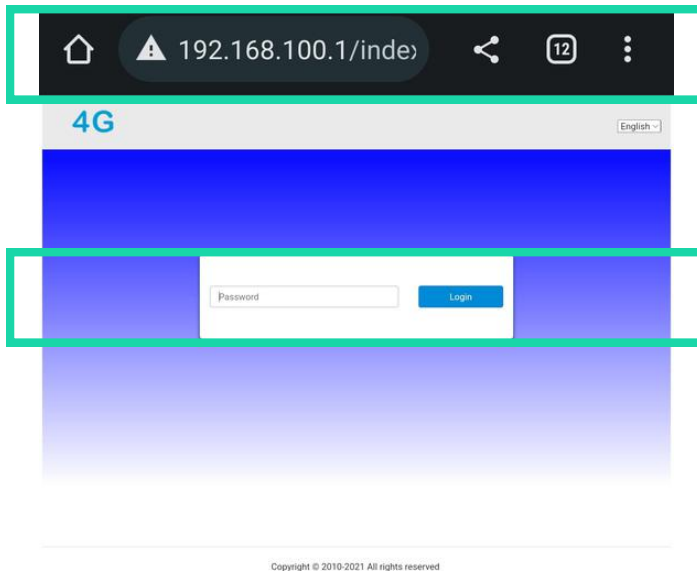

WiFi name: MIFI_XXXX

Password: 1234567890

CHANGING APN SETTINGS

Once connect, you will need to open your phones web browser and follow the instructions below.

Type in 192.168.100.1 into the address bar and click on your keyboards enter button.

You'll now be prompted with a login page.

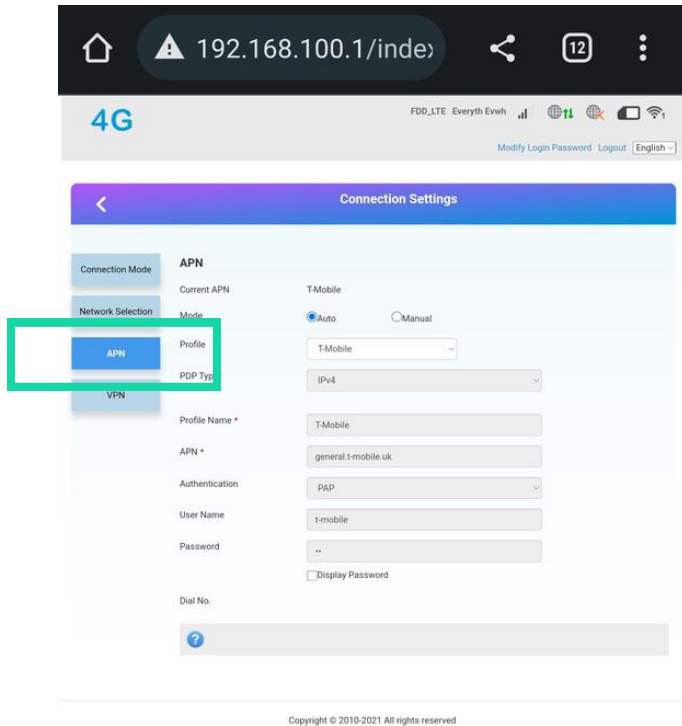

The password is: admin

Select 'Network Settings'.

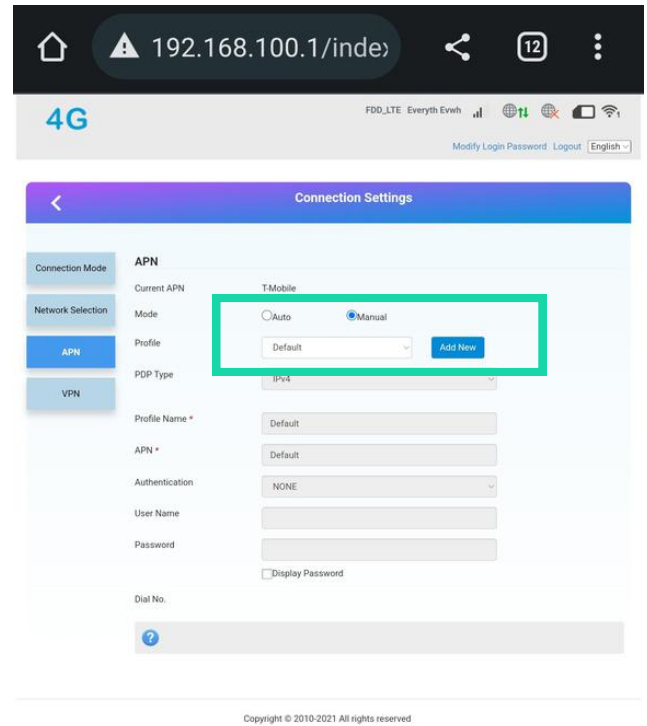

Screenshot this page and send it to us if you're having connectivity issues.

Ensure connection status is set to on.

CHANGING APN SETTINGS

Click on the APN menu on the left hand side.

Click the the 'Manual' radio button then click 'Add New'.

In this example we are using an EE SIM card therefore are entering EE's APN settings. You can do a quick Google search to find your providers settings. Once entered, double check details are correct and click 'Apply'

CHANGING APN SETTINGS

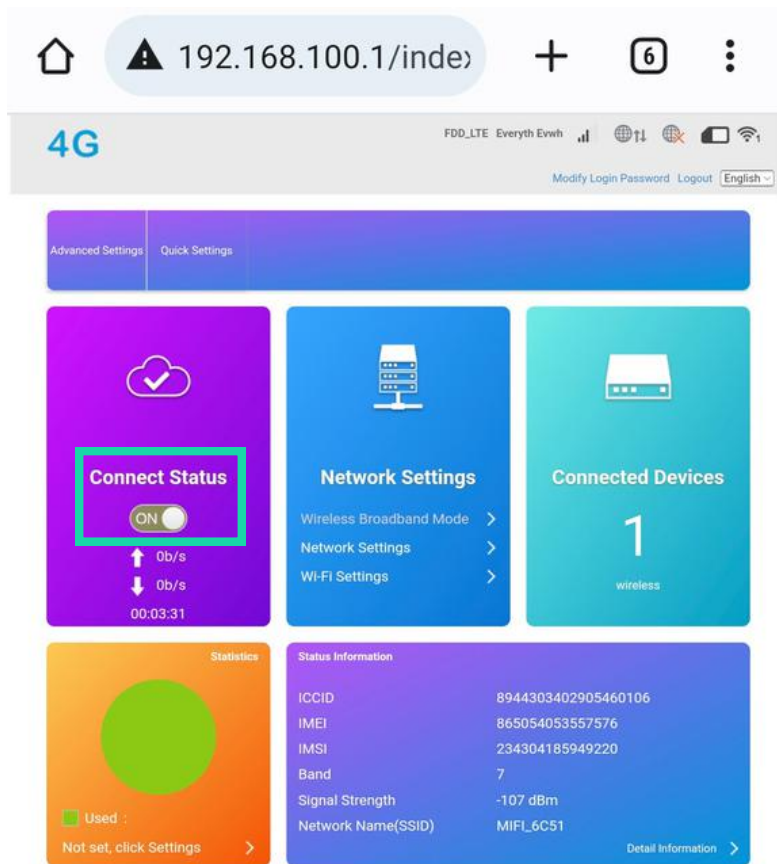

Select 'Yes' on the pop-up that appears.

At this point, your phone will disconnect from your 4G cameras WiFi hotspot. You may need to reconnect to the WiFi in your phones settings.

CHANGING APN SETTINGS

When you have reconnected to your cameras WiFi hotspot, log back into the admin webpage and ensure the connection status is 'On'. You can turn it on by clicking on the slider.

To test your camera is now successfully connected, while connected to your 4G cameras WiFi hotspot navigate to www.fast.com in your web browser and run an internet speed test. Please note, you'll require at least 2Mbps for a smooth experience.

Ensure you disconnect from your cameras WiFi hotspot when testing the camera is connected in the CamhiPro app.

Still having trouble?
Send us a screenshot of the screen above.
